In our computer science classes, we've been taught that we don't always need to represent a logical problem in the countable form. Instead, we can use the natural numbers, i.e. $\$0.1.2.3...\$$ For example, in order to have a representation of the decimal number $\$123.45678910111213...\$$ we can write $\$\$123.45678910111213=10\cdot 9\cdot 8\cdot 7\cdot 6\cdot 5\cdot 4\cdot 3\cdot 2\cdot 1\$$ (The source of this representation is the internet, so I'm not too sure where it came from.) Now, I was wondering if there is a formal term for this? I think it is called "domains of indiscernibility", but this isn't quite the right word. I am not interested in when we should use the natural numbers to solve a logical problem. I just am interested in whether there is 1d6a3396d6

Malware Information: 'SKID' is a Trojan which is installed to the computer in an attempt to trick the user into purchasing the fake security software to stop the virus. 'SKID' uses the same techniques as other viruses, typically infecting executable files. 'SKID' may then display a warning message. 'SKID' may be used to redirect the web browser to a web site where the user may be prompted to purchase fake security software. 'SKID' may be used to display pop-up messages or program shortcuts. 'SKID' may also collect the user's personal information, and send it to unknown servers. 'SKID' may also be used to display itself as a Windows system process. 'SKID' may try to prevent the user from running certain programs, or display a fake security warning. 'SKID' may try to block access to parts of the operating system, and may even cause the computer to enter a fake 'blue screen of death'. 'SKID' may access the user's web browsers, and download additional malware onto the computer. 'SKID' may also try to send email from the computer to other users. 'SKID' may not be removed by 'Ad-Aware' or 'Spybot' anti-virus programs. Download Counter: Loading...
